Quick Instructions

How to use and edit the NIKON camera Mockup

This natural looking, modern NIKON digital camera Mockup can be used to showcase your featured images by editing and replacing the PSD Layer with the smart object.

The perspective correction and light reflections will be added and rendered automatically after saving and updating the smart object.

That's what you need to do:

1. Open the included PSD-File.
2. Open the layers window in Photoshop (if it isn't already open)
3. To replace the image on the iPhone screen, open the layer folder "YOUR IMAGE" and double-click on the smart object "YOUR PHOTO".
4. Photoshop will open the smart object in a separate window – here you can place any image/text content you want to be displayed on the display of the camera in the resulting Mockup.
5. After editing the smart objet close that window and hit "save" when Photoshop asks.
6. The smart object will be updated and the light effects added.
7. Done!
